Why take the risk?

Sir,

We read with interest the mini systematic review of articiane compared to lidocaine in relation to nerve damage for inferior alveolar nerve blocks (IANB)\(^1\). The paper provides a review of some of the literature regarding 4% articiane with 1:100 000 adrenaline and, as the authors’ state, there remains controversy within the evidence base regarding whether there is an increased risk of nerve damage with use of articiane. However, an important point to be considered is that although the literature clearly demonstrates that 4% articiane 1:100 000 adrenaline is superior to 2% lidocaine 1:80 000 adrenaline for infiltration anaesthesia, this is not the case for IANB\(^2,3\), the two solutions being equally effective. Therefore, as there is no benefit in using articiane over lidocaine for IANB, then the potential risk of nerve damage, however small, should lead to the conclusion “why take the risk?”
